Motivation

Old Workflow - R to LATEX

1. Do some cool stuff in R:

```
mod1 <- lm(mpg~hp, data = mtcars)
with(mtcars, plot(mpg~hp))
abline(mod1)
summary(mod1)</pre>
```

- 2. Copy/save the output/figure.
- 3. Paste into Latex document:

```
\begin{verbatim}
mod1 <- lm(mpg~hp, data = mtcars)
...
\includegraphics{figures/mpg.pdf}</pre>
```

Old Workflow - Problems

- What if we need to make a change?
- Latex is hard and requires a lot of boilerplate.
- Distracting: doesn't facilitate higher-order thinking.

Reproducibility

- ▶ If I win the lottery and drop out of graduate school, could someone else pick up where I left off?
- ▶ How long would it take them to do so?

Interactivity

- ▶ We live in the future. Why should our documents be static?
- ► Interactive documents are useful to everyone: ourselves, our students, executives, etc.

New Workflow

New Workflow - Unified Document

- 1. Do some cool stuff in RMarkdown.
- 2. Push button.
- 3. Get PDF.

New Workflow - Write Code

```
title: "Example"
   author: "Andrew Mullins"
   date: "November 2, 2015"
    output: pdf_document
    Here is some cool R stuff:
10
   mod1 <- lm(mpg~hp, data = mtcars)
    with(mtcars, plot(mpg~hp))
11
12
13
    summary(mod1)
14 -
15
16
    We can do equations too. \scriptstyle =1_{k-1} a_{ij} a_{jk}.
17
18
```

New Workflow - Push Button

```

 8:27
       (Top Level) $
                                                                                 R Markdown =
```

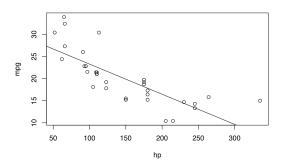

New Workflow - Get PDF 1

Example

Andrew Mullins November 2, 2015

Here is some cool R stuff:

```
mod1 <- lm(mpg-hp, data = mtcars)
with(mtcars, plot(mpg-hp))
abline(mod1)</pre>
```

New Workflow - Get PDF 2

```
## ## Call:
## lm(formula = mpg - hp, data = mtcars)
## ## Residuals:
## Min 1Q Median 3Q Max
## -5.7121 -2.1122 -0.8854 1.5819 8.2360
## ## Coefficients:
## Estimate Std. Error t value Pr(>|t|)
```

New Workflow - Get PDF 3

We can do equations too:

$$\sum_{i=1}^{k-1} a_{ij} a_{jk}$$

•

$$\frac{1}{\sigma\sqrt{2\pi}}e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

New Workflow - Make a change

Just change it in one place and press button.

Other Tools

Sweave

Problem: Sometimes we need the fine-tuned control you can get with Latex.

Solution: Sweave let's use get both the power of Latex while still being able to use in-line ${\sf R}$ code.

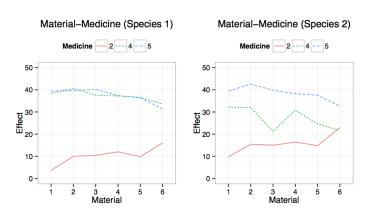

Sweave Example Code

```
202
     In the ANOVA table above, there is evidence that the effect of the medicine-material
     interaction is different between the two species. Here are two plots visualizing
     this relationship:
203
204
     \beain{figure}[H]
205
     \caption{\textbf{Interaction Plots}}
206 < <<intplot1, echo=FALSE, fig.height = 4>>=
207
208
     species1clean <- species1 %>%
209
      filter(!(Medicine %in% c(1,3)))
210
211
     species2clean <- species2 %>%
212
       filter(!(Medicine %in% c(1,3)))
213
     intp1 <- aaplot(species1clean, aes(x=Material, v = Effect,
214
                                         group = Medicine,
215
                                         color = Medicine,
216
                                         ltv = Medicine)) +
217
       stat_summary(fun.y = mean, geom = "line") +
218
       ggtitle("Material-Medicine (Species 1)") +
219
       vlim(0.50) + theme_bw() + theme(legend.position = "top")
```

Sweave Example Output

In the ANOVA table above, there is evidence that the effect of the medicine-material interaction is different between the two species. Here are two plots visualizing this relationship:

Interaction Plots

xtable/stargazer

Problem: R output is ugly.

Solution: xtable/stargazer creates Markdown/Latex code that is inserted into your document as-is.

xtable Example Code

```
188
     \section*{Analysis}
189
     Having prepared the data for analysis as described above, I fit a three-way ANOVA
     model with interactions. Here is the resulting ANOVA table:
190 ▼ <<anova1. echo=FALSE. results='asis'>>=
191
     # Three-way ANOVA
192
     infecmod <- lm(Effect~Medicine*Material*Species, data = infectedClean)</pre>
193
     print(xtable(summary(aov(infecmod)).
194
                  caption = c("Three-way ANOVA")), table.placement = "H",
195
           caption.placement = "top")
196
```

xtable Example Output

Three-way ANOVA

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Medicine	2	20373.03	10186.52	1580.67	0.0000
Material	5	291.80	58.36	9.06	0.0000
Species	1	74.76	74.76	11.60	0.0009
Medicine:Material	10	1686.17	168.62	26.16	0.0000
Medicine:Species	2	1963.14	981.57	152.31	0.0000
Material:Species	5	90.58	18.12	2.81	0.0187
Medicine:Material:Species	10	134.32	13.43	2.08	0.0293
Residuals	144	928.00	6.44		

stargazer Example Code

stargazer Example Output

Appendix - Tables and Charts

Summary of Effect Variable

Statistic	N	Mean	St. Dev.	Min	Max
Effect	300	17.743	16.046	0	44

broom

Problem: A lot of common R objects have bizarre inner structure.

broom - Example: 1m

```
Call:
lm(formula = mpg \sim wt + qsec, data = mtcars)
Residuals:
   Min 10 Median 30 Max
-4.3962 -2.1431 -0.2129 1.4915 5.7486
Coefficients:
          Estimate Std. Error t value Pr(>|t|)
(Intercept) 19.7462 5.2521 3.760 0.000765 ***
wt -5.0480 0.4840 -10.430 2.52e-11 ***
gsec 0.9292 0.2650 3.506 0.001500 **
Signif. codes: 0 '*** 0.001 '** 0.01 '* 0.05 '.' 0.1 ' 1
Residual standard error: 2.596 on 29 degrees of freedom
Multiple R-squared: 0.8264, Adjusted R-squared: 0.8144
F-statistic: 69.03 on 2 and 29 DF, p-value: 9.395e-12
```

broom - Example: 1m

```
> str(mod2)
List of 12
$ coefficients : Named num [1:3] 19.746 -5.048 0.929
 ..- attr(*. "names")= chr [1:3] "(Intercept)" "wt" "asec"

  ..- attr(*, "names")= chr [1:32] "Mazda RX4" "Mazda RX4 Waa" "Datsun 710" "Hornet 4 Drive"
$ effects : Named num [1:32] -113.65 -29.116 -9.103 0.357 0.503 ...
  ..- attr(*, "names")= chr [1:32] "(Intercept)" "wt" "qsec" "" ...
              : int 3
$ rank
$ fitted.values: Named num [1:32] 21.8 21 25.3 21.6 18.2 ...
  ..- attr(*, "names")= chr [1:32] "Mazda RX4" "Mazda RX4 Wag" "Datsun 710" "Hornet 4 Drive
 $ assign : int [1:3] 0 1 2
              :List of 5
 $ qr
 ..$ ar : num [1:32, 1:3] -5.657 0.177 0.177 0.177 0.177 ...
  ...- attr(*, "dimnames")=List of 2
 .....$: chr [1:32] "Mazda RX4" "Mazda RX4 Wag" "Datsun 710" "Hornet 4 Drive" ...
  .. .. ..$ : chr [1:3] "(Intercept)" "wt" "qsec"
  .. ..- attr(*, "assign")= int [1:3] 0 1 2
```

broom - Example: 1m

```
library(broom)
tidy(mod2)[,1:4]
```

```
## term estimate std.error statistic

## 1 (Intercept) 19.746223 5.2520617 3.759709

## 2 wt -5.047982 0.4839974 -10.429771

## 3 qsec 0.929198 0.2650173 3.506179
```

broom - Supports

- ▶ lm, glm, htest, anova, nls, kmeans, manova
- ► TukeyHSD, arima, lme4, glmnet, boot, gam
- ▶ survival, lfe, zoo, multcomp, sp, maps, ...
